in Malaita. It is very doubtful that the beach walls serve for defense, since they do not form any real obstacle against an attack and, /Fig. 15 appears [illegible]e/ in the absence of breastworks, grant no protection against arrows. Rather, it seems as though by means of them the people held solid the fairly steep slope of the village terraces toward the sea and through that, to escape from the forest, established themselves

[P95(D)]

131 are scattered over some 15,000 square miles of the Pacific Ocean just north of the New Hebrides Islands. Santa Cruz, a volcanic island, is the largest in the group as well as its financial center. About 25 miles to the north is a chain of small coral islets called the Reef Islands, and midway between these and Santa Cruz [133] is Tinakula, a volcano too spectacularly [361] active for human settlement. The Duff Islands, 60 miles northeast of the Reefs, are remnant peaks of a narrow volcanic ridge. The only other large islands of the group are Utupua and Vanikoro, respectively some 40 and 60 miles south of Santa Cruz.

177 Partly as the result of a long history of inhospitality to visiting mariners and missionaries, the islands were left pretty much to themselves even through the first two decades of this century, when colonial powers were asserting dominion over other islands in the Pacific. It was not until 1923 that the British assumed [648] direct administration of the islands, which they had claimed since 1899, and only since World War II has the Santa Cruz group actually been drawn into the current of world affairs. Today some 161 7,000 people inhabit the islands, most of them concentrated along the north coast of Santa Cruz and in the eastern Reef Islands. The people of the Duffs 144 and the western Reefs speak a Poly- 197 nesian language and are racially similar to the Polynesians of the central Pacific islands. The darker Melanesians of the eastern Reefs and Santa Cruz itself speak four local languages that constitute an independent language family. Melanesians also live on Utupua and Vanikoro, but their three languages belong to the large Malayo-Polynesian 184 family. The cultures of Santa Cruz and 436 the islands north of it are similar in spite 438 of language and racial differences, and it is through this area that the red-

WHEN A PRIMITIVE AND A CIVILIZED MONEY MEET

William Davenport

IT IS A COMMON story these days to read of a primitive economic system or even large segments of an entire social structure which have become greatly altered by the direct or indirect effects of the society coming into contact and participation with the Western money economy. It is held by many that the universality of our money, a medium by which standardized values can be fixed to almost any good or service, is one of the main factors in this kind of change, for primitive societies are frequently organized around more than one system of valuation. One anthropologist[1] has termed this "multicentric," by which he refers to the fact that one system of valuation is frequently applicable to a limited set of transactions, while a different system is required in another set, and moreover, that these are not in theory convertible.

I shall attempt here to outline the current situation among some islands in the southwest Pacific where this is *not* the case. Here Australian money is competing with an indigenous system of universal currency, which, for all we know, has been in existence for centuries. It is an unusual situation, for owing to their economic behavior which is determined by a strong profit motive, the people want both, yet the native currency is disappearing.

The Santa Cruz Group, lying two hundred miles east of the main British Solomons, are a complex of volcanic islands, true atolls, and raised atolls in which live about six thousand people.[2] They speak eight different languages: one Polynesian, three other Malayo-Polynesian but of a different stock from Polynesian, and four others, related to each other, but as yet unrelated to anything else. The northern part of this group consists of Santa Cruz Island, the largest; the Reef Islands, thirty miles to the north; and the Duff Islands, still fifty miles further out to the northeast. The culture in these is, by Melanesian standards, fairly homogeneous, and from the economic point of view, it is convenient to think of them as participating in a single economic system.

One of the striking things about this island economy is the number of district and island specialties. These embrace a wide range of skills and services, among which are agricultural specialties, animal husbandry, fishing techniques, and many arts and crafts such as canoe making, loom weaving, and clothing and ornament manufacture. Some of these crafts require the bringing of raw materials from one district or island to another before the products are manufactured and the finished goods are redistributed throughout the group. These specialties are largely inherited patrilineally, and many are protected from expropriation by others by magical and supernatural means. Despite this individuality in production, there is a high correlation of certain specialties with the ecological zone within which it is found. For example, specialized fishing techniques are to be found associated with types of reefs, with lagoons, or their absence; pig breeding with abun-
